

Water and Energy Disputes of Central Asia: In search of regional solutions?

Regional cooperation and its alternatives as solution paths for the water and energy disputes in Central Asia by Natalia Mirimanova

Water and energy resources are not limited in Central Asia, contrary to recent suggestions by some commentators both from within and outside the region. Fuel-rich Kazakhstan, Turkmenistan and Uzbekistan have a non-water energy source, but need water from the Syrdarya and Amudarya rivers that rise in the mountains of Kyrgyzstan and Tajikistan and from the Amudarya in Afghanistan and Tajikistan for irrigation. A clear case for regional cooperation, one would suggest. A classic win-win 'orange' case from the "Getting to Yes" bestseller: one sister needs just a peel to make a cake, while the other needs to squeeze juice, and they can have all they want. In the case of the Central Asian water-energy puzzle, all it should take to arrive at a mutually beneficial solution is to negotiate the solution. However, today

the water and energy distribution conflict is predominantly being treated by Central Asian states as a zero-sum game. In the end, everybody loses.

Are there objective criteria that could facilitate the parties' cooperation on the water distribution matters that would be cost-effective? In other words, is there a law that prescribes what the parties should do in this kind of situation?

Stephen Hodgson, consultant in environmental law and policy from Brussels explains why one should not pin too much hope on international law in this regard. Since becoming independent, the five Central Asian states have signed several inter-state agreements, not to mention numerous external interventions that were crowned with most international agreements on the water use and distribution matters. However the trend of going around in circles with no breakthrough clearly presents itself. There is no global framework agreement for fresh water resources. EU water law is concerned with water quality issues: the EC has no competence over water quantity or water rights. This means that the water relations of the Central Asian States ought to be governed by customary international law. However the requirements that 'watercourse states' must use an international water course on their own territory in an equitable and reasonable manner or must take all appropriate measures to avoid causing significant harm to other watercourse states. And the states have general duties to cooperate, to exchange data and information, and to consult on planned measures and if such consultations do not reach a satisfactory outcome, to negotiate in a meaningful way. Should the states in question have polar positions, hostile relations of a lack of will to negotiate, the existing laws are of little help to encourage them to cooperate? The requirements on the negotiation in a meaningful way

and equitable and reasonable manner of water use and water flow management leave quite a lot of room for interpretation. Key to water disputes in Central Asia are sustained, effective, institutionalised and principled negotiations. But this is exactly the challenge, because the search for solutions to water use and distribution problems ought to be happening outside the domain of rigidly and narrowly conceived national sovereignty. In sum, regional cooperation cannot be effectively promoted through international water law, and the EU cannot do much within the legal framework to alleviate water and hydropower contests in Central Asia.

The compound crisis in October 2008 provoked by the concerns of the downstream countries that Kyrgyzstan and Tajikistan might operate Toktogul and Nurek in full hydropower mode pushed the five countries to pledge renewed effort to cooperate on the hydro-energy issues. Does this mean that the situation needs to get really bad in order for the Central Asian states to actually move towards regional cooperation on water and energy? One sensible way to get out of the vicious circle of mistrust and fear could be to foster each party's own, internally driven energy security so that each country could re-enter the regional cooperation discussion having strengthened their water-energy base. Alfiya Alborova, Head of the Renewable Energy Sources from the Tajik Technical University in Dushanbe, proposes national solutions to the regional hydropower contest that are long-term and development-minded. This requires a paradigm shift away from the present short-term profit-driven strategies in this sector. Her suggestions fall into two clusters: energy and water saving, and development of renewable sources of energy. She proposes to concentrate on water and energy-saving policies and strategies, such as revision of agricultural patterns, modernisation of the existing

EUCAM, in cooperation with Asian Development Bank, Carnegie Endowment for International Peace and the Wolfensohn Centre for Development (Brookings Institution), organised a conference on Regional Cooperation and Development in Central Asia. The event was hosted by CEPS on March 2-3, 2009. The gathering was marked by a broad range of perspectives on the constellation of interests, capacities and motivations regarding a more integrated Central Asia. Water resource issues that largely define the relationships between the Central Asian states were discussed from various angles by Central Asian and international experts and representatives of major donor agencies (Aga Khan Development Network and UNDP)

irrigation systems and, most importantly, changing people's habits as regards the use of water. Renewable sources of energy – solar and wind – can be easily and successfully developed in all Central Asian countries. Decentralisation of energy supply that renewable energy sources provide for is the way to the energy security, suggests Ms. Akhrova. What is important is that this approach strengthens water-energy autonomy of each country but not at the expense of others. The first steps and proposals that were developed in cooperation between academic institutes and universities from Central Asia (Tajikistan and Kazakhstan) and Europe (Greece, Sweden and Finland) include a strategy for the creation of market incentives to develop renewable energy, new relevant legislation, training for the new cadre and scientific research.

Aly Nazerali, European and Multilateral Representative and COE of the Aga Khan Development Network in London proposed to focus on the water and energy needs of individual families and livelihoods and to go local and supply those at the geographic, economic and political periphery with small yet reliable hydropower mini-plants and local water systems. Grand regional cooperation or national energy and water issues take a long time to be agreed upon and even more time to attract investments and actually start producing electricity, while people's well-being, health and development, especially of the millions in rural and mountainous areas, are being harmed on a daily basis. Those who are

systematically deprived of access to electricity and water are the focal point for the Aga Khan Development Fund assistance programmes. UNDP supports the small-scale and local focus of work on energy and water security, as well as on the promotion of renewable energy sources. But it stresses that without radical reform of the energy sectors, most importantly breaking the monopolies and introducing competition on the supply side and introducing energy-saving and metering programmes on the consumer side, long-term sustainable solution to the permanent crises will not be reached. From the UNDP perspective, which was presented by Ben Slay, Senior Economist, UNDP Bureau for Europe and CIS, Bratislava, while the most important elements of the response to water, energy and food insecurities in Central Asia should have a national character, the regional focus should be continued, to provide joint and continual monitoring of, and early warning concerning hydrological trends in the reservoirs and rivers of regional importance, economic developments, environmental and climate forecast, etc. among other cooperative measures.

This array of views on the prospects for the resolution of water-energy issues across Central Asia through regional cooperation, national and local efforts presents the EU with a menu to select entry points and develop strategies on a regional response to regional, national and local challenges in the water and energy sectors in Central Asia.

The Fundación para las Relaciones Internacionales y el Diálogo Exterior (FRIDE), Spain, in co-operation with the Centre for European Policy Studies (CEPS), Belgium, has launched a joint project entitled "EU Central Asia Monitoring (EUCAM)". The (EUCAM) initiative is an 18-month research and awareness-raising exercise supported by several EU member states and civil society organizations, which aims: to raise the profile of the EU-Central Asia Strategy; to strengthen debate about the EU-Central Asia relationship and the role of the Strategy in that relationship; to enhance accountability through the provision of high quality information and analysis; to promote mutual understanding by deepening the knowledge within European and Central Asian societies about EU policy in the region; and to develop 'critical' capacity within the EU and Central Asia through the establishment of a network that links communities concerned with the role of the EU in Central Asia.

EUCAM focuses on four priority areas in order to find a mix between the broad political ambitions of the Strategy and the narrower practical priorities of EU institutions and member state assistance programmes: Democracy and Human Rights; Security and Stability; Energy and Natural Resources ; Education and Social Relations

This monitoring exercise is implemented by an Expert Working Group, established by FRIDE and CEPS. The group consists of experts from the Central Asian states and the members countries of the EU. In addition to expert meetings, several public seminars will be organised for a broad audience including EU representatives, national officials and legislators, the local civil society community, media and other stakeholders.

EUCAM is sponsored by the Open Society Institute (OSI) and the Netherlands Ministry of Foreign Affairs. The project is also supported by the Czech Republic Ministry of Foreign Affairs, the Spanish Ministry of Foreign Affairs and Cooperation and the United Kingdom Foreign and Commonwealth Office.

FRIDE is a think tank based in Madrid that aims to provide original and innovative thinking on Europe's role in the international arena. It strives to break new ground in its core research interests – peace and security, human rights, democracy promotion and development and humanitarian aid – and mould debate in governmental and nongovernmental bodies through rigorous analysis, rooted in the values of justice, equality and democracy.

Founded in Brussels in 1983, the Centre for European Policy Studies (CEPS) is among the most experienced and authoritative think tanks operating in the European Union today. CEPS serves as a leading forum for debate on EU affairs, and its most distinguishing feature lies in its strong in-house research capacity, complemented by an extensive network of partner institutes throughout the world. CEPS aims to carry out state-of-the-art policy research leading to solutions to the challenges facing Europe today and to achieve high standards of academic excellence and maintain unqualified independence. CEPS also provides a forum for discussion among all stakeholders in the European policy process and builds collaborative networks of researchers, policy-makers and business representatives across the whole of Europe.
